

$$1. \sinh(x) = \frac{e^x - e^{-x}}{2}, \quad \cosh(x) = \frac{e^x + e^{-x}}{2}$$

$$\Rightarrow \sinh(x) + \cosh(x) = \frac{e^x - \cancel{e^{-x}} + e^x + \cancel{e^{-x}}}{2} = \frac{2e^x}{2} = e^x$$

$$\Rightarrow \boxed{\sinh(x) + \cosh(x) = e^x} \quad \text{where } \sinh(x) \text{ is odd}$$

and $\cosh(x)$ is even

2. $f(x)$ is periodic if $f(x) = f(x+p) \quad \forall x$.
 ↳ with period p .

Let $f(x)$ and $g(x)$ be periodic functions with period T .

$$\text{Then } f(x+T) = f(x) \quad \text{and} \quad g(x+T) = g(x)$$

$$\text{Let } h(x) = f(x) + g(x)$$

Claim $h(x) = h(x+T)$ always.

Proof:

$$\text{Since } h(x) = f(x) + g(x), \quad h(x+T) = f(x+T) + g(x+T)$$

$$\text{note that } f(x+T) = f(x) \quad \text{and} \quad g(x+T) = g(x),$$

$$f, g \text{ are periodic} \Rightarrow h(x+T) = g(x) + f(x) = h(x)$$

$$\therefore h(x) = h(x+T) \quad \therefore h(x) \text{ is periodic.}$$

3. $\sin(x) + \sin(\pi x)$. The period of $\sin(x)$ is 2π .

The period of $\sin(\pi x)$ is $\frac{2\pi}{\pi} = 2$

Let $h(x) = \sin(x) + \sin(\pi x)$.

if $h(x) = h(x+p)$ for some period p

$$\Rightarrow \sin(x) + \sin(\pi x) = \sin(x+p) + \sin(\pi(x+p))$$

$$\text{if } \sin(x) = \sin(x+p) \Rightarrow p = 2\pi$$

$$\text{if } \sin(\pi x) = \sin(\pi(x+p)) \Rightarrow p = 2$$

therefore $\sin(x) + \sin(\pi x)$ can't be periodic.

at the end

4. Show $\sin\left(\frac{2\pi nt}{T}\right)$ and $\cos\left(\frac{2\pi mt}{T}\right)$ are orthogonal

if $m=n \Rightarrow \sin\left(\frac{2\pi nt}{T}\right)$ and $\cos\left(\frac{2\pi nt}{T}\right)$. $\{n=m \neq 0\}$

by the identity $\cos(x) \sin(x) = \frac{\sin(2x)}{2}$

$$\Rightarrow \int_0^T \sin\left(\frac{2\pi nt}{T}\right) \cos\left(\frac{2\pi nt}{T}\right) dt = \frac{1}{2} \int_0^T \sin\left(\frac{4\pi nt}{T}\right) dt$$

$$w = \frac{4\pi nt}{T}, \quad dw = \frac{4\pi n}{T} dt \Rightarrow \frac{T}{4\pi n} dw = dt \quad n \neq 0$$

$$\text{then } \frac{1}{2} \int_0^T \sin\left(\frac{4\pi nt}{T}\right) dt = \frac{1}{2} \int_0^T \sin(w) \cdot \frac{T}{4\pi n} dw$$

$$= \frac{1}{2} \cdot \frac{T}{4\pi n} \cdot \left. -\cos\left(\frac{4\pi nt}{T}\right) \right|_0^T$$

$$= \frac{T}{8\pi n} \left(-\cos(4\pi n) + \cos(0) \right) = \frac{T}{8\pi n} (-\cos(4\pi n) + 1)$$

$$\because \sin \cos(x) \text{ is even, } \forall n, n \neq 0 \quad \frac{T}{8\pi n} (-\cos(4\pi n) + 1) = 0$$

Case 2 $m \neq n$

by the trigonometric identity $\sin(x) \cos(y) = \frac{1}{2} (\sin(x+y) - \sin(x-y))$

$$\text{we get } \sin\left(\frac{2\pi nt}{T}\right) \cos\left(\frac{2\pi mt}{T}\right) = \left(\sin\left(\frac{2\pi nt}{T} + \frac{2\pi mt}{T}\right) - \sin\left(\frac{2\pi nt}{T} - \frac{2\pi mt}{T}\right) \right) \frac{1}{2}$$

$$\text{Aside: } \frac{2\pi nt}{T} + \frac{2\pi mt}{T} = \frac{2\pi nt + 2\pi mt}{T} = \frac{2\pi t(n+m)}{T}$$

$$\frac{2\pi nt}{T} - \frac{2\pi mt}{T} = \frac{2\pi t(n-m)}{T}$$

$$\Rightarrow \sin\left(\frac{2\pi nt}{T}\right) \cos\left(\frac{2\pi mt}{T}\right) = \frac{1}{2} \left(\sin\left(\frac{2\pi t(n+m)}{T}\right) - \sin\left(\frac{2\pi t(n-m)}{T}\right) \right)$$

$$\text{then, } \left(\sin\left(\frac{2\pi nt}{T}\right), \cos\left(\frac{2\pi mt}{T}\right) \right) = \frac{1}{2} \int_0^T \sin\left(\frac{2\pi t(n+m)}{T}\right) dt$$

$$- \frac{1}{2} \int_0^T \sin\left(\frac{2\pi t(n-m)}{T}\right) dt$$

$$u = \frac{2\pi t(n+m)}{T}$$

$$w = \frac{2\pi t(n-m)}{T}$$

$$du = \frac{2\pi(n+m)}{T} dt$$

$$dw = \frac{2\pi(n-m)}{T} dt$$

$$\frac{T}{2\pi(n+m)} du = dt$$

$$\frac{T}{2\pi(n-m)} dw = dt$$

Now, \therefore

$$\frac{1}{2} \int_0^T \frac{\sin(u) \cdot T}{2\pi(n+m)} du - \frac{1}{2} \int_0^T \frac{\sin(w) \cdot T}{2\pi(n-m)} dw$$

$$= \frac{T}{4\pi(n+m)} \left[-\cos\left(\frac{2\pi t(n+m)}{T}\right) \right]_0^T + \frac{T}{4\pi(n-m)} \left[\cos\left(\frac{2\pi t(n-m)}{T}\right) \right]_0^T$$

$$= \frac{T}{4\pi(n+m)} \left(-\cos(2\pi(n+m)) + \cos(0) \right) + \frac{T}{4\pi(n-m)} \left(\cos(2\pi(n-m)) - \cos(0) \right)$$

Since $\cos(x) = \cos(-x)$, $\cos(2\pi(n+m)) = \cos(-2\pi(n+m)) = 1$

$$= \frac{T}{4\pi(n+m)} (-1+1) + \frac{T}{4\pi(n-m)} (1-1) = 0 \quad \checkmark$$

If $m=0$ always \Rightarrow check $\sin\left(\frac{2\pi n t}{T}\right)$, $\cos(0)=1$
 is $\sin\left(\frac{2\pi n t}{T}\right) \perp 1$?

$$\int_0^T \sin\left(\frac{2\pi n t}{T}\right) dt, \quad \left. \begin{array}{l} w = \frac{2\pi n t}{T} \\ dw = \frac{2\pi n}{T} dt \end{array} \right\} \frac{T dw}{2\pi n} = dt$$

$$\Rightarrow \int_0^T \frac{\sin(w) \cdot T}{2\pi n} dw = \left. \frac{-\cos\left(\frac{2\pi n t}{T}\right) \cdot T}{2\pi n} \right|_0^T$$

$$= -\frac{\cos(2\pi n) \cdot T}{2\pi n} + \frac{T}{2\pi n} = 0 \checkmark$$

$$\therefore \left(\sin\left(\frac{2\pi n t}{T}\right), \cos\left(\frac{2\pi m t}{T}\right) \right) = 0 \quad \text{for } \begin{array}{l} m=n, m \neq 0 \\ m=0, n \neq 0 \\ m \neq n \end{array}$$

$\therefore \sin\left(\frac{2\pi n t}{T}\right) \wedge \cos\left(\frac{2\pi m t}{T}\right)$ are orthogonal.

5. $\{f_1, f_2, f_3\}$ with $f_1(x)=1$
 $f_2(x)=x$
 $f_3(x)=\frac{3x^2-1}{2}$ } is an orthogonal set
 if $(f_i, f_j)=0$
 $\forall i, j, i \neq j$

$$\int_0^1 f_1 \cdot f_2 dx = \int_0^1 x dx = \frac{x^2}{2} \Big|_0^1 = \frac{1}{2}$$

$$\begin{aligned} \int_0^1 f_1 \cdot f_3 dx &= \int_0^1 \frac{3x^2-1}{2} dx = \frac{1}{2} \int_0^1 3x^2 dx - \frac{1}{2} \int_0^1 1 dx \\ &= \frac{1}{2} \cdot \left(\frac{3x^3}{3} - \frac{1}{2} \cdot x \right) \Big|_0^1 = \frac{1}{2} \left(1 - \frac{1}{2} \right) = \frac{1}{2} \left(\frac{2-1}{2} \right) = \frac{1}{2} \left(\frac{1}{2} \right) \end{aligned}$$

$$= \frac{1}{4}$$

$$\begin{aligned} \int_0^1 f_2 \cdot f_3 dx &= \int_0^1 x \cdot \left(\frac{3x^2-1}{2} \right) dx = \int_0^1 \frac{3x^3-x}{2} dx = \frac{1}{2} \int_0^1 (3x^3-x) dx \\ &= \frac{1}{2} \left(\frac{3x^4}{4} - \frac{x^2}{2} \right) \Big|_0^1 = \frac{1}{2} \left(\frac{3}{4} - \frac{1}{2} \right) = \frac{3}{8} - \frac{1}{4} = \frac{3-2}{8} = \frac{1}{8} \end{aligned}$$

$\{f_1, f_2, f_3\}$ is not an orthogonal set on the interval $(0,1)$.

on the interval $(-1, 1)$: $\int_{-1}^1 f_1 \cdot f_2 \, dx = \int_{-1}^1 x \cdot 1 \, dx = \frac{x^2}{2} \Big|_{-1}^1 = \frac{1}{2} - \frac{1}{2} = 0 \checkmark$

$$\int_{-1}^1 f_1 \cdot f_3 \, dx = \int_{-1}^1 1 \cdot \frac{1}{2}(3x^2 - 1) \, dx = \frac{1}{2} \left(\frac{3x^3}{3} - x \right) \Big|_{-1}^1 = 0 \checkmark$$

$$= 0.5(1-1) - 0.5(1-1) = 0$$

$$\int_{-1}^1 f_2 \cdot f_3 \, dx = \int_{-1}^1 x \cdot \frac{1}{2}(3x^2 - 1) \, dx = \int_{-1}^1 \frac{3x^3 - x}{2} \, dx = \frac{1}{2} \left(\frac{3x^4}{4} - \frac{x^2}{2} \right) \Big|_{-1}^1$$

$$= 0.5 \left(\frac{3}{4} - \frac{1}{2} \right) - 0.5 \left(\frac{3}{4} - \frac{1}{2} \right) = 0 \checkmark$$

$\therefore \{f_1, f_2, f_3\}$ is an + set on the interval $(-1, 1)$
